

Don't Let Cold Weather Freeze Your Business

Charge A/C Systems Year-Round

model
S365

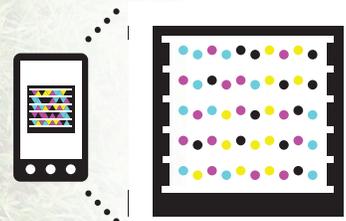

Traditionally, HVACR techs couldn't charge TXV systems in cold weather because the low temp removes too much heat from the condenser coils.

Now, the new Fieldpiece Charging Jacket solves that problem. It's as simple as adjusting the Jacket until the proper difference between the high side and low side pressures is reached. The adjustment fakes out the A/C unit to think it's hotter outside than it is.

The Charging Jacket is a great way to extend work hours throughout the year:

- Charge TXV systems from 37°F —70°F outside temp
- More work in the slow season
- Service maintenance contracts before the summer heat
- Quickly stabilizes pressures

To learn how the Charging Jacket can help keep the winter freeze from slowing down your business, see it in action with this TAG phone app.
